

Compliance Stack Audit - How it can help you?

Entec has developed a stack audit program that can help you do a final QA/QC on your current stack tests and give you confidence that your data has been reported accurately. **Entec** has conducted several audits that have uncovered numerous reporting errors. We have found wrong stack dimensions, miscalculated emission data, unreported cyclonic flow, etc. Accurately determining and reporting this data should be standard practice for your testing company as required by EPA Testing Procedures. **Entec** can provide data for comparison and provide our clients with an in depth QA/QC program that shows you every detail that is required by EPA. When conducting stack tests, **Entec** makes no assumptions about test parameters based on previous test data. Specific QA/QC procedures and guidelines are followed every time a source is tested in order to provide the most accurate data possible with no questions about accuracy.
